**Montana State University**, Bozeman, MT

Bachelor of Science in Economics, Summa Cum Laude, 2018

Minor in Computer Science

## JOB MARKET PAPER

---

**Do Hot Deals Beat the Heat? Does Green Space Keep Bringing in the Green? The Effects of Heat and Green Space on City Storefronts:** Climate change is increasing the frequency and intensity of extreme heat events, particularly in cities. This paper estimates the causal effect of temperature on daily revenue using over 15,000 consumer-facing storefronts in the 49 largest U.S. cities between 2019 and 2023. Above 35 °C (95 °F), revenue falls steeply, averaging 9 percent lower on days above 37.5 °C (99.5 °F) days than on 20 °C (68 °F) days. Consumption smoothing across days mitigates some damage from an extreme heat event, but a 1.3 percent revenue drop persists for two weeks following a hot day. Therefore, I estimate how effective urban green space is as a climate adaptation strategy that can prevent revenue losses caused by extreme heat ex ante. I find that a one percent increase in tree cover surrounding a storefront increases revenue by 0.94 percent on hot days. A 10 percent increase in surrounding tree cover eliminates revenue losses at 37.5 °C and reduces them by half at 40 °C, relative to areas without canopy. Storefronts located in the Southwest and South have the most to gain from urban tree cover. On average, businesses in this region can cover the cost of moving to a 10 percent tree cover scenario in four years with the avoided revenue losses. This length of time shortens under projected climate scenarios. These results suggest that green infrastructure can improve firm resilience to heat, providing evidence of a private incentive to finance urban green space that could simultaneously provide a positive externality.
